## **Patient Information**

### **MICRODERMABRASION CONSENT FORM**

The Microdermabrasion procedure removes surface layer skin and stimulates the production of new, fresh cells and collagen. It is a non-invasive, non-surgical procedure that will help to reduce the visible signs of aging and improve the vitality of texture of the skin. It uses vacuum suction and crystal flow to create a mechanical exfoliation treatment of the skin. I understand that improvement usually takes a series of treatments and those treatments can be performed every 2 weeks for the most benefit.

I understand that most patients experience no adverse effect whatsoever. However, it is possible for the skin to be red, sensitive, and sometimes mild peeling may occur after a treatment which is all temporary. Although rare, sometimes the treatment can cause sensitive or thin skin to appear more vascular. I agree to contact the office immediately if any of these side effects are extreme or persist. I agree to the diligent use of a sunscreen of at least SPF 30 for a week after my treatment and to limit sun exposure and tanning beds.
